

This is the IR Mod for the Digital Concepts 2.1 Pix Camera. As always this will void the warranty of this camera. No one here is responsible for you destroying your camera.

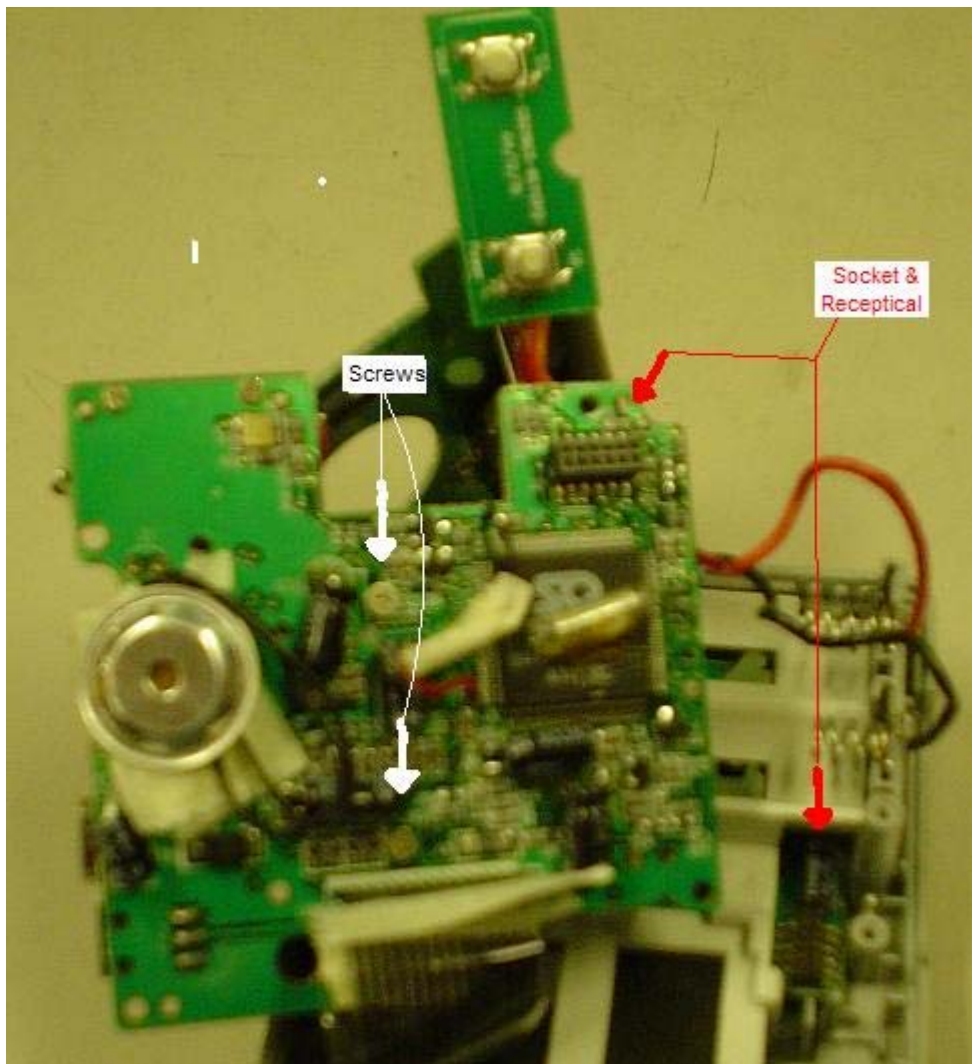

Step 1: You will already have the face of your camera off. The first thing is remove the 2 screws in the upper right hand corner. Wiggle the board loose from the electrical socket and receptacle on the backside of the top board and the middle board. (See 2nd picture) Move the board up and out of the way.

Step 2: Remove the 8 screws from the second board. Separate the board from the back case and let it fall forward, it will still be attached by a ribbon cable.

Step 3: Mark the position of the lens assembly, it appears to go only one way. When reassembling make sure it seats evenly around the sensor. Remove the 2 screws that hold the lens assembly from the backside of the middle board

Step 4: The IR filter we want to remove is now exposed. Take a small screwdriver and break the seal around the IR filter or take the screwdriver and tap on the face of the IR filter till it breaks, and remove it in pieces. This is a very thin and brittle piece of glass.

Step 5: You have just completed the IR modification and now reassemble in reverse

order. No refocusing has to be done just reassembly.
